Hi Frenz,

Today morning when I was talking to one of my colleague, he questioned me “Sudheer – What’s today’s BODI tip?” and at the spur of the moment an idea popped up in my mind (Somehow my mind is driving crazy and working pretty sharply these days 😊). Why can’t I share DI tips which I’m aware of and which would be useful.

*Note: You can find all my technical tips by selecting the “Tip of the day” in the category list starting from today.*

### Today’s tip topic – Compact Repository

Compacting/Compressing the local repository on regular basis would definitely help your repo to respond quickly. What happens is... whenever you save any object in DI designer, the new version of the object information will be written into your local repo. Repository compression process removes the unnecessary and obsolete information from your local repo and thus helps to respond your repo quickly.
